

Meeting summary — Jakarta EE Future Directions, June 12, 2025

Jared Anderson provided an overview of Jakarta EE 12 planning, starting with context from Jakarta EE 11. He highlighted that EE 12 is still early in development, with several specifications planned for updates and some new or potential specifications under consideration, including Jakarta Config, Query, NoSQL, and possibly MicroProfile-related technologies.

Key themes included the move toward Java 21 as the minimum level for Jakarta EE 12, with Java 25 expected for ratifying implementations, continued removal of Security Manager dependencies, and further movement toward CDI-centric programming models. Jared also noted possible breaking changes in areas such as Faces, Validation, Persistence, CDI, and other major-version updates.

The group discussed how MicroProfile could affect Jakarta EE 12, especially whether MicroProfile Config may become Jakarta Config and how versioning and namespace migration might work. Jared emphasized that these decisions are still under discussion and depend on MicroProfile and Jakarta EE community votes.

Additional topics under consideration for EE 12 include deprecating the Application Client Container, reducing JNDI dependency in favor of CDI, possible HTTP/3 support, virtual-thread integration, and the long-term future of EJB. Neil closed by asking participants to suggest topics for future meetings and to help promote the interest group to broader Java and Jakarta EE communities.
